### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows:

Claims 25-46 have been canceled.

Claim 47, line 6: "a linking" has been changed to --a first linking--.

Line 11: "said linking" has been changed to --a second linking--.

2. The following is an examiner's statement of reasons for allowance: the prior art fails to teach a device that has a first, second and third region, wherein each region of the device contains a reagent used for the detection of analyte. The first region has a first reagent, a "target of a secondary antibody", which is a primary antibody, linked directly to the support through a linker, wherein the target of a secondary antibody is capable of binding to a secondary antibody and an analyte of interest. The second region has a secondary antibody conjugated to a ligand (such as biotin) that is bound directly to the region through a first linker and is capable of binding to both the primary antibody and a binding partner of an enzyme conjugate. The third region has an enzyme conjugated to a binding partner that is bound directly to the third region through a second linker and is capable of binding to the ligand of the secondary antibody conjugate. Cosgrove et al. (US 5,143,714) teach a quality control device with different concentrations of target immobilized to a region and then subsequently adding a primary antibody, secondary antibody conjugate and enzyme conjugate for testing reagent control and consistency. The final assay (target, primary antibody, secondary antibody conjugate and enzyme conjugate) is developed for staining only after all reagents are added and is not detected separately after each reagent is added.

Art Unit: 1641

Cosgrove et al. do not teach immobilizing each of the reagents in different amounts in separate regions. Bogen et al. (US 6,281,004) teach a quality control device having a target, a primary antibody, secondary antibody conjugate and an enzyme conjugate individually added onto the SAME quality control region and do not teach separately immobilizing each reagent on the substrate.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
